Quay Walls is a practical handbook, bringing together the expertise of a number of organisations and individuals. It provides essential information regarding the planning, design, execution and maintenance of quay walls. Furthermore, it relates the historic development of ports and considers the lessons learned from experience of port construction in various countries.

Chapters which focus on technique, are followed by a detailed calculation of a quay wall, based on semi-probabilistic design procedure, which serves to illustrate the theory presented.

Quay Walls is intended for anyone involved in the design, construction and use of quay walls, including designers, contractors, engineers, operators and managers. It also provides a rich source of basic information for university and professional students.

CUR is an independent non-profit organisation committed to the development, acquisition and transfer of knowledge and experience in the areas of construction, civil engineering and urban & rural planning. CUR initiates and co-ordinates joint research projects with both public bodies and private companies. The results are disseminated through the publication of reports, recommendations and codes of practice, as well as through the organisation of seminars and other meetings.

“...This is a publication that should be found in the engineering section of every technical library and should be purchased by anybody who has a serious interest in quay walls... an extremely comprehensive treatise...” Terra et Aqua, no. 102, March 2006
